Med-Surg Private Headwall
Ideal for skilled nursing labs

A vertical headwall that generates vacuum and air by just plugging into electrical wall outlet.. This is a very inexpensive method of simulating air, oxygen and vacuum for teaching institutions versus the traditional method of installing a complete system that could cost thousands of dollars to install. No need for vacuum plants, air compressors or manifolds nor running hard copper piping through out the building, which requires major construction. Simply hang the unit on the wall and plug into an electrical receptacle to generate vacuum and medical air. In a matter of an hour you can have a fully functional working simulated gas system.
